Dataset Information:

Title	**Manure left on pastures**
Abstract	Greenhouse Gases (GHG) emissions data from manure left on pasture consist of nitrous oxide gas from nitrogen additions to managed soils from grazing livestock. Computed at Tier 1 following the 2006 IPCC Guidelines for National GHG Inventories, Vol. 4 (IPCC, 2006); available by country, with global coverage and relative to the period 1990 onwards, with annual updates.
Supplemental	This domain contains data on GHG emissions, associated emission factors and underlying activity data. The FAOSTAT Emissions data are estimates by FAO and do not coincide with GHG data reported by member countries to UNFCCC. The database is intended primarily as a service to help member countries assess and report their emissions, as well as a useful international benchmark. The FAOSTAT Emissions data are disseminated publicly to facilitate continuous feedback from member countries.
Creation Date	2012
Last Update	2013
Data Type	Climate Change - Greenhouse Gases
Category	Environment
Time Period	1990 onwards
Periodicity	Annual
Geographical Coverage	World
Spatial Unit	Country
Language	Multilingual (EN, FR, ES)

Methodology and Quality Information:

Methods and processing	GHG emissions from manure left on pastures consist of direct and indirect nitrous oxide (N_2O) emissions from manure nitrogen (N) left on pastures by grazing livestock. Specifically, N_2O is produced by microbial processes of nitrification and de-nitrification taking place on the deposition site (direct emissions), and after volatilization/re-deposition and leaching processes (indirect emissions). The FAOSTAT data are estimated at Tier 1 following the IPCC, 2006, Vol. 4, Ch. 10 and 11. Direct emissions are estimated at country level, using the formula: *Emission = A * EF* where: *Emission* = GHG emissions in kg yr^{-1}; *A* = Activity data, representing the total amount of manure N left on pasture in kg N yr^{-1} (1); *EF* = Tier 1, default IPCC emission factors, expressed in kg N_2O-N/kg N yr^{-1} (2). (1) Computed as per IPCC, 2006: Vol.4, Ch. 11, Eq. 11.5, as the amount of total N excreted (see below, note i) by livestock (ii) and left on pastures as urine and dung (iii). (i) Following IPCC, 2006: Vol.4, Ch. 10, Eq. 10.30, the total *amount of nitrogen excreted in manure* is calculated, for each livestock category, by the number of livestock heads by two coefficients: a) the Typical Animal Mass (TAM) and b) the N excretion coefficient (N_{ex}). Both parameters vary according to geographic region. TAM values are obtained from IPCC, 2006: Vol.4, Ch. 10, Annex 10A.2 Tabs. 10A-4 to 10A-9; N_{ex} values are derived from IPCC, 2006: Vol.4, Ch. 10, Tab. 10.19. (ii) Data for buffalo, sheep, goats, camels, llamas, horses, mules, asses, ducks, turkeys, dairy cattle* and chickens layers** are taken directly from FAOSTAT (domain: Production); non-dairy cattle is derived from FAOSTAT categories, specifically as cattle

minus dairy cattle; chickens broilers is derived from FAOSTAT categories, specifically as chickens minus chickens layers; market and breeding swine are calculated respectively as 10% and 90% of FAOSTAT category pigs (IPCC, 2006, Vol.4, Ch.10, Tab.10.19).

* FAOSTAT livestock data include cattle and dairy cattle. Dairy cattle data are expressed as heads of cows producing milk, and can be found under the domain Production/Livestock Primary by selecting the item cow milk, whole fresh and the element producing animals.

** FAOSTAT livestock data include the items chicken and chicken layers. Chicken layers are expressed in 1000 heads of hens which have laid eggs in the reference period, and can be found under the domain Production/Livestock Primary by selecting the item hen eggs, in shell and the element producing animals.

(iii) Default IPCC percentages of total excreted N in different Manure Management Systems (MMS) by region and livestock category, as per IPCC, 2006: Vol.4, Ch. 10, Annex 10A.2 Tabs. 10A-4 to 10A-9 (for poultry: IPCC, 1997: Vol.3, Ch.4, Tab. 4.21). Specifically with reference to these tables, the amount of manure left on pasture contributing to GHG emissions is the sum of 100% of total excreted N left on pasture as per IPCC percentage value "Pasture/Range/Paddock", and 50% of total excreted N as per IPCC percentage value "Burned for Fuel" (IPCC, 2006: Vol. 4, Chapter 10 Page 10.58).

(2) Global default EF values taken from IPCC, 2006: Vol. 4, Chapter 11, Tab. 11.1.

Indirect emissions are estimated at country level, using the formula:

*Emission = A * EF*

where:

Emission = GHG emissions in kg yr^{-1};
A = Activity data, representing the fraction of manure N left on pastures that volatizes as NH_3 and NO_x and is lost through runoff and leaching in kg N yr^{-1} (3);
EF = Tier 1, default IPCC emission factors, expressed in kg N_2O-N/kg N yr^{-1} (4).

(3) Obtained through the volatilization and leaching factors in IPCC, 2006: Vol.4, Ch. 11, Tab. 11.3.

(4) Global IPCC default EF values from IPCC, 2006: Vol.4, Ch. 11, Tab. 11.1.

Dimensionless conversion factors used are:
44/28, to convert the emissions from kg N_2O-N to kg N_2O gas;
10^{-6}, to convert the emissions from kg N_2O to Gg N_2O; and
GWP-N_2O = 310 (100-year time horizon global warming potential), to convert Gg N_2O to Gg CO_2eq (IPCC, 1996: Technical Summary, Tab. 4 pg. 22).

The manure left on pastures domain contains the following data categories available for download: country-level GHG emissions, provided as total, direct and indirect amounts in both Gg N_2O and Gg CO_2eq; implied emission factors; and activity data. Data are available for all countries and territories, as well as for standard FAOSTAT regional aggregations, plus Annex I and non-Annex I groups. The data period is 1990 onwards, with annual updates.

Uncertainties in estimates of GHG emissions are due to uncertainties in emission factors and activity data. They may be related to, inter alia, natural variability, partitioning fractions, lack of spatial or temporal coverage, spatial aggregation. In the case of manure left on pastures more detailed information is available in the guidelines (IPCC, 2006: Vol.4, Ch. 11, Section 11.2.1.4 for direct emissions, and Section 11.2.2.4 for indirect emissions).
